
ROMMEL VALDIVIEZO

MOBILE SOFTWARE ENGINEER

Quito, 170530 Ecuador ♦ 593963356744 ♦ alexanderommelsw@gmail.com

PROFESSIONAL SUMMARY

Mobile software engineer specializing in fintech platforms, building and scaling native Android and iOS applications used by 500,000+ users. Experienced in payment systems, modular mobile architectures, and reliability improvements that reduce transaction failures. Proven ability to lead mobile initiatives from MVP to production.

SKILLS

Mobile: Kotlin, Swift, XML, UIKit, Jetpack Compose, SwiftUI, MVVM, Clean Architecture, Modular Architecture

Platforms: Android, iOS

Security: Mobile obfuscation, encryption, secure SDK integrations

Tools & Practices: Firebase, Fastlane, Git, Azure DevOps, Scrum, LLM-assisted development.

WORK HISTORY

Specialist Mobile Developer, 11/2024 - Present

PayPhone – Remote

Develop native Android and iOS applications for a fintech payment platform serving **500,000+ users**, supporting the rebuild of the company's mobile platform for U.S. expansion.

- Contributed to the design of a modular Android architecture enabling coexistence of legacy and expansion features while supporting gradual migration toward Jetpack Compose and MVVM.
- Designed and implemented mobile features for digital card issuance and cross-border transfers, integrating payment APIs and SDKs in collaboration with backend and product teams.
- Rebuilt UI components to align with a centralized design system defined by the product team.
- Redesigned the Tap-to-Phone NFC integration, reducing payment failures reported in Firebase Crashlytics and improving transaction processing time; introduced structured logging and resolved architectural inconsistencies to improve reconciliation and reduce revenue leakage.
- Applied mobile security hardening practices including obfuscation, version enforcement, and Google Play Integrity verification aligned with PCI DSS requirements.
- Managed Android and iOS production releases (Play Store and App Store) and proposed CI/CD pipelines using Fastlane and Azure DevOps included automatic testing and build validation.

- Developed LLM-assisted development workflows using Claude Code and Cursor to accelerate debugging, code analysis, and cross-platform feature implementation.

Lead Mobile Developer, 03/2022 - 12/2024

Willay – Remote

Led mobile engineering for the startup MVP, rebuilding an early prototype into a mobile platform for vehicle inspections, supporting growth from launch to **2,000+ completed inspections**.

- Migrated the MVP from Xamarin to a native Android platform, redesigning a modularized architecture using Kotlin, XML layouts, Clean Architecture, and MVVM.
- Developed a camera and document-processing module combining device camera APIs, ML Kit, and OCR to enable automated vehicle inspection and data extraction workflows.
- Designed and developed the native iOS application (Swift, SwiftUI, Combine), extending the platform into a cross-ecosystem mobile solution.
- Defined mobile-backend API contracts and introduced CI pipelines using Bitrise and GitHub.
- Contributed to product direction in an early-stage startup, proposing and implementing features that supported customer adoption and platform growth.

Full-Stack Developer, 05/2024 - 09/2024

Escuela Politécnica Nacional – Quito, Ecuador (Freelancer)

Designed and delivered a web platform to automate research project application workflows for the university's Research Directorate, supporting a department serving **100+ researchers**.

- Led end-to-end development from concept to production, designing the system architecture and implementing backend and frontend components using Java EE, JBoss, PostgreSQL, JPA, and JSP.
- Implemented a configurable rules engine for evaluation workflows, enabling administrators to modify approval logic without code changes and reducing the need for production redeployments.

PERSONAL PROJECTS

Sherom — Intelligent Vehicle Maintenance Platform (Personal Project)

Built an end-to-end vehicle maintenance platform that generates personalized maintenance schedules and cost planning using vehicle usage data. Architected backend services in .NET, developed a native Android application and a React/Next.js web platform, and deployed production infrastructure on Microsoft Azure.
