
ROMMEL VALDIVIEZO

MOBILE SOFTWARE ENGINEER

Quito, 170530 Ecuador ♦ 593963356744 ♦ alexanderommelsw@gmail.com

PROFESSIONAL SUMMARY

Mobile software engineer specializing in fintech platforms, building and scaling native iOS and Android applications used by 500,000+ users. Experienced in payment systems, modular mobile architectures, application reliability and mobile security. Proven ability to lead mobile initiatives from MVP to production.

SKILLS

Mobile: Swift, UIKit, CocoaPods, SPM, SwiftUI, Kotlin, XML, MVVM, Clean Architecture, Modularization

Platforms: iOS, Android

Security: Mobile obfuscation, encryption, secure SDK integrations

Tools: Firebase, Fastlane, XCTest, Azure DevOps, Jira, LLM integration, AI-assisted development

WORK HISTORY

Specialist Mobile Developer, 11/2024 - Present

PayPhone – Remote

Contributed to the complete modernization of iOS and Android applications for a fintech payment platform serving **500,000+ users**, supporting the rebuild of the company's mobile platform for U.S. expansion.

- Helped drive the evolution of the iOS and Android architecture from a monolithic codebase to a standardized modular architecture, enabling coexistence of legacy and new market-specific features while supporting the incremental adoption of SwiftUI, SPM, Jetpack Compose and MVVM.
- Implemented identity verification, digital card issuance, cross-border transfers and customer engagement features by integrating APIs and SDKs in collaboration with backend and product teams.
- Redesigned the Tap-to-Phone NFC integration, reducing payment failures reported in Firebase Crashlytics and improving transaction processing time; introduced structured logging and resolved architectural inconsistencies to improve reconciliation and reduce revenue leakage.
- Applied mobile security hardening practices including obfuscation, version enforcement, and Google Play Integrity verification aligned with PCI DSS requirements.
- Managed iOS and Android production releases (App Store and Play Store), proposed CI/CD pipelines using Fastlane and Azure DevOps and participated in pull request reviews.
- Defined and implemented UI tagging standards to support Appium-based QA automation.

- Enhanced LLM-assisted development with custom workflows and tools using Claude Code and Cursor to accelerate debugging, code analysis, and cross-platform feature implementation.

Lead Mobile Developer, 03/2022 - 12/2024

Willay – Remote

Led mobile engineering for the startup MVP, rebuilding an early prototype into a mobile platform for vehicle inspections, supporting growth from launch to **2,000+ completed inspections**.

- Migrated the MVP from Xamarin to a native Android platform, redesigning a modularized architecture using Kotlin, XML layouts, Clean Architecture, and MVVM (Eventually moved from XML to Compose).
- Developed a camera and document-processing module combining device camera APIs, ML Kit, and OCR to enable automated vehicle inspection and data extraction workflows.
- Designed and developed the native iOS application (Swift, SwiftUI, Combine, CoreData, URL Session, AV Foundation), extending the platform into a cross-ecosystem mobile solution.
- Defined mobile-backend API contracts and introduced CI pipelines using Bitrise and GitHub.
- Contributed to product direction in an early-stage startup, proposing and implementing features that supported customer adoption and platform growth.

Full-Stack Developer, 05/2024 - 09/2024

Escuela Politécnica Nacional – Quito, Ecuador (Freelancer)

Designed and delivered a web platform to automate research project application workflows for the university's Research Directorate, supporting a department serving **100+ researchers**.

- Led end-to-end development from concept to production, designing the system architecture and implementing backend and frontend components using Java EE, JBoss, PostgreSQL, JPA, and JSP.
- Implemented a configurable rules engine for evaluation workflows, enabling administrators to modify approval logic without code changes and reducing the need for production redeployments.

PERSONAL PROJECTS

Entrevia — AI Voice Mock Interview Platform (Personal Project)

Built an AI-powered mock interview platform for technical and behavioral interview preparation. Integrated OpenAI, Vapi, and ElevenLabs to enable real-time voice interview simulations with contextual AI responses. Developed the platform using React/Next.js and deployed it on Vercel.
